## Part 3 – Two Solutions to Eliminate Security Holes

### Parameterised Query

The screenshot shows a REST client interface. The URL bar displays `http://localhost:3000/productsol1/?name=';DELETE FROM PRODUCTS WHERE id=22 OR title LIKE '`. The request method is set to GET. The response status is 200 OK, with a time of 24 ms and a size of 212 B. The response body is empty, shown as `[]`.

After entering in the query, it does not delete from the database as it is prone to SQL Injection.

```
ppgsql=# select * from products;
```

## Stored Procedure

The screenshot shows a REST client interface. The top bar indicates a GET request to `http://localhost:3000/productssol2/?name=';DELETE FROM PRODUCTS WHERE id=22 OR title LIKE '`. The status is 200 OK, time is 26 ms, and size is 212 B. The response body is empty, shown as `[]`.

After entering in the query, it does not delete from the database as it is prone to SQL Injection.

```
ppgsql=# select * from products;

The database is unaffected after entering in the SQL Injection query.

### Note:

- `/products/?name=...` - Ability to perform SQL Injection
- `/productssol1/?name=...` - Parameterised Query (SQL Injection Prevention)
- `/productssol2/?name=...` - Stored Procedure (SQL Injection Prevention)

***All is explained in the code on how this is done.***

## Part 4 – Sequelize ORM

### Setup

1. `npm install --save sequelize-cli`
2. `node_modules/.bin/sequelize init`

The following folders are created:

- config
- models
- migrations
- seeders

### Folder Structure

Inside the folder **Sequelize-ORM** the README.txt contains the setup commands in creating models and migrations.

### Note

- It's important to add the “**updated\_at**” column to ensure that the appropriate associations are all set up and working with the models.

## Part 5 – Test Data (Seeders)

### Product – Sample Data
